Roll no. 39

→ PS :

Write a Java Program to implement method ~~overriding~~ over loading ~~in~~ & method overriding in Java.

→ Objective :

1) To study method over loading

2) to study method overriding

→ Theory :

Method over loading :

a feature in Java where multiple methods have the same name, but different parameters in the same class

E.g. -

int area (int side)
int area (int length, int breadth)

advantages :

- better readability
- Code reusable
- flexibity
- Compile time polymorphism

Method overriding & its rule :

a sub class performs a implementation of a method defined in the parent class

Rules :

- must have same name, param & type
- must be in child class
- cannot override final, static or private method
- access modifier should be same or less restrictive
- happens at run time

→ FAQs :

Q1 can we use overload java main() method ?

→ Yes we can overload, but JVM only calls og main method

Q2 Can overloaded methods be final?

→ Yes, overloaded methods can be declared final.
This prevents them from being overriden, but does not affect overloading in the same class

Q3 Can overloaded methods be overridden?

→ Yes, if a subclass defines a method w the same signature as one of the overloaded methods, that specific method can be overridden

Q4 What is method overriding?

→ method overriding is redefining a super class w the same name, params and return type to provide specific implementation.

Q5 What happens if arguements are changed?

→ If the parameter list differ, it is treated as method overloading, not overriding

Q6 Can return type change
(Number → Integer) ?

→ Yes, return type can change if it is covarient type (subclass of og return type), such as Integer from Number
